## Supplementary Tables and Table Legends

**Supplementary Table 1 – Patient demographics and clinical characteristics.**

ID	Age	Sex	TBI Mechanism	iGCS	Acute fMRI (days post-injury)	CRS-R at Acute fMRI	LoC at Acute fMRI	GCS at Acute fMRI	Follow-up fMRI (days post-injury)	Large Focal Lesions on Acute Structural MRI
P1	27	M	MVA	5T	16	23	PTCS	15	206	R frontal and parietal contusions; small R frontal subdural hemorrhage
P2	21	M	Ped vs. car	4-8T	1	4	MCS	7	174	L frontal EVD tract
P3	19	F	MVA	5T	3	1	Coma	5T	371	None
P4	34	M	Fall	5T	15	3	UWS	6T	-	Bifrontal contusions; R frontoparietal contusion
P5	28	F	MVA	3	7	6	UWS	9T	656	L frontal contusion
P6	45	M	MVA	5T	13	18	MCS	13	-	None
P7	33	M	Fall	5-7T	8	20	PTCS	11T	-	R posterior temporal contusion; L anterior temporal contusion
P8	32	M	Ped vs. car	5-7T	11	9	MCS	10T	-	Hemorrhage in splenium of corpus callosum
P9	24	M	Assault	3-7T	12	10	MCS	10	-	R anterior temporal contusion; L tentorial subdural hemorrhage
P10	22	F	Ped vs. car	6T	14	22	PTCS	14	187	L temporo-parietal contusion; R thalamic hemorrhage
P11	27	F	Fall	3	8	1	Coma	5T	-	R anterior temporal contusion
P12	18	M	Fall	3-7	4	12	MCS	10T	-	L frontal contusion
P13	51	M	Ped vs. car	3	8	3	UWS	6T	-	R frontal contusion; L frontal and L mesial temporal contusions
P14	29	M	Ped vs. car	4-7	7	3	MCS	7T	235	L insular contusion; R frontal EVD tract
P15	33	M	Fall	3-4	3	12	MCS	10T	191	None
P16	26	F	Ped vs. truck	3-3T	12	2	UWS	8T	-	R anterior temporal and L posterior temporal contusions; R frontal and L temporal subdural hemorrhages
P17	26	M	Fall	4T	14	18	PTCS	11	190	L temporal contusion; L frontal EVD tract

The initial Glasgow Coma Scale (iGCS) is defined as the best (i.e. highest) and worst (i.e.

lowest) post-resuscitation GCS score assessed by a qualified clinician who performed a reliable

examination (not confounded by sedation and/or paralytics) prior to ICU admission. Level of consciousness (LoC) is assessed via behavioral evaluation with the Coma Recovery Scale Revised (CRS-R) as coma, unresponsive wakefulness syndrome (UWS), minimally conscious state (MCS), or post-traumatic confusional state (PTCS). Large focal lesions do not include microhemorrhages detected by susceptibility-weighted imaging or punctate lesions detected by T2-weighted or diffusion-weighted MRI. Other abbreviations: EVD = external ventricular drain; fMRI = functional MRI; L = left; MVA = motor vehicle accident; Ped = pedestrian; R = right; TBI = traumatic brain injury.

**Supplementary Table 2 – Sedative, anxiolytic, and analgesic medications administered before and during functional MRI.**

ID	Medication(s) Administered Before fMRI	Medication(s) Administered During fMRI
P1	Diazepam 2.5 mg PGT	Morphine 6 mg IV
P2	None	None
P3	Propofol 300 mg/hr IV gtt	Propofol 300 mg/hr IV gtt
P4	Lorazepam 1 mg IV	None
P5	Hydromorphone 0.5 mg IV	Hydromorphone 0.5 mg IV
P6	Quetiapine 12.5 mg PGT	None
P7	Propofol 300 mg/hr IV gtt	Propofol 400 mg/hr IV gtt + Hydromorphone 0.5 mg
P8	Propofol 200 mg/hr IV gtt	Propofol 200 mg/hr IV gtt
P9	None	None
P10	Lorazepam 1 mg IV	Haloperidol 5 mg IV
P11	Propofol 50 mg/hr IV gtt	Propofol 50 mg/hr IV gtt
P12	Propofol 300 mg/hr IV gtt	Propofol 300 mg/hr IV gtt
P13	Fentanyl 50 mcg IV + Propofol 20 mg IV	Propofol 25 mg/hr IV gtt
P14	Propofol 300 mg/hr IV gtt + Fentanyl 50 mcg IV	Propofol 200 mg/hr IV gtt
P15	Propofol 300 mg/hr IV gtt + Fentanyl 50 mcg IV	Propofol 300 mg/hr IV gtt
P16	50 mcg fentanyl 2h prior to fMRI	None
P17	None	None

Abbreviations: gtt = continuous infusion; IV = intravenous; PGT = administered via percutaneous gastric tube.

**Supplementary Table 3 – Effect of FDR- versus FWE-correction.**

ID	FDR-Corrected		FWE-Corrected

P15*	0.84	-0.69	0.84	-0.69
P17*	1.06	-0.51	1.06	-0.51

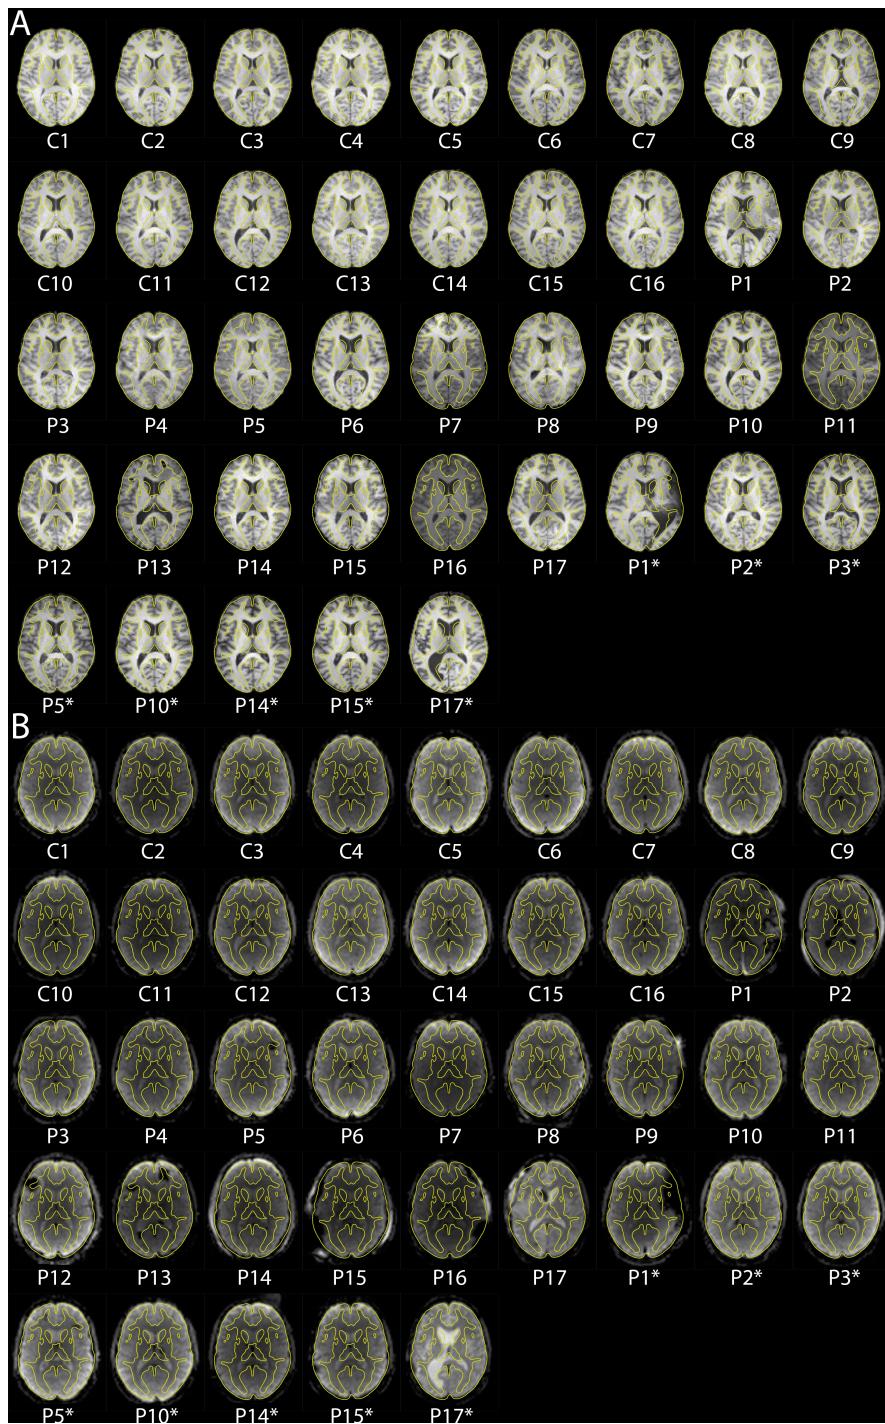

Global correlation and anticorrelation z-scores for each subject as calculated by cluster-level

$P < 0.05$  FDR- and FWE-correction for multiple comparisons. C1-C16 = healthy controls; P1-P17

= acute patient scans; \* = follow-up patient scans.

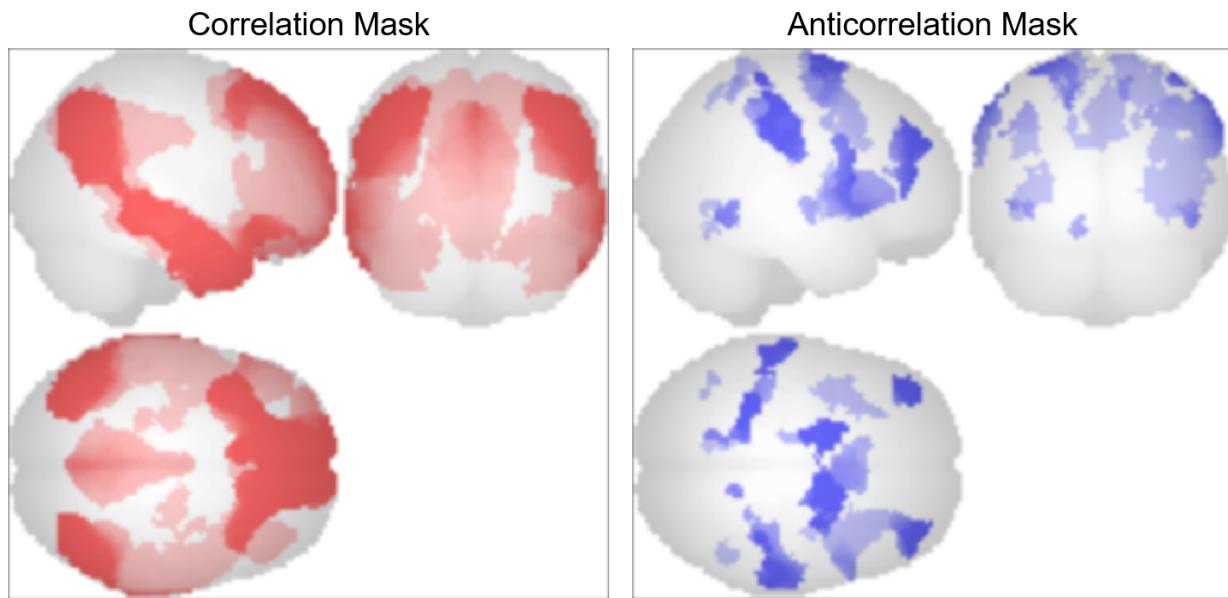

## Supplementary Figures

### Supplementary Fig. 1 – Normalization quality control.

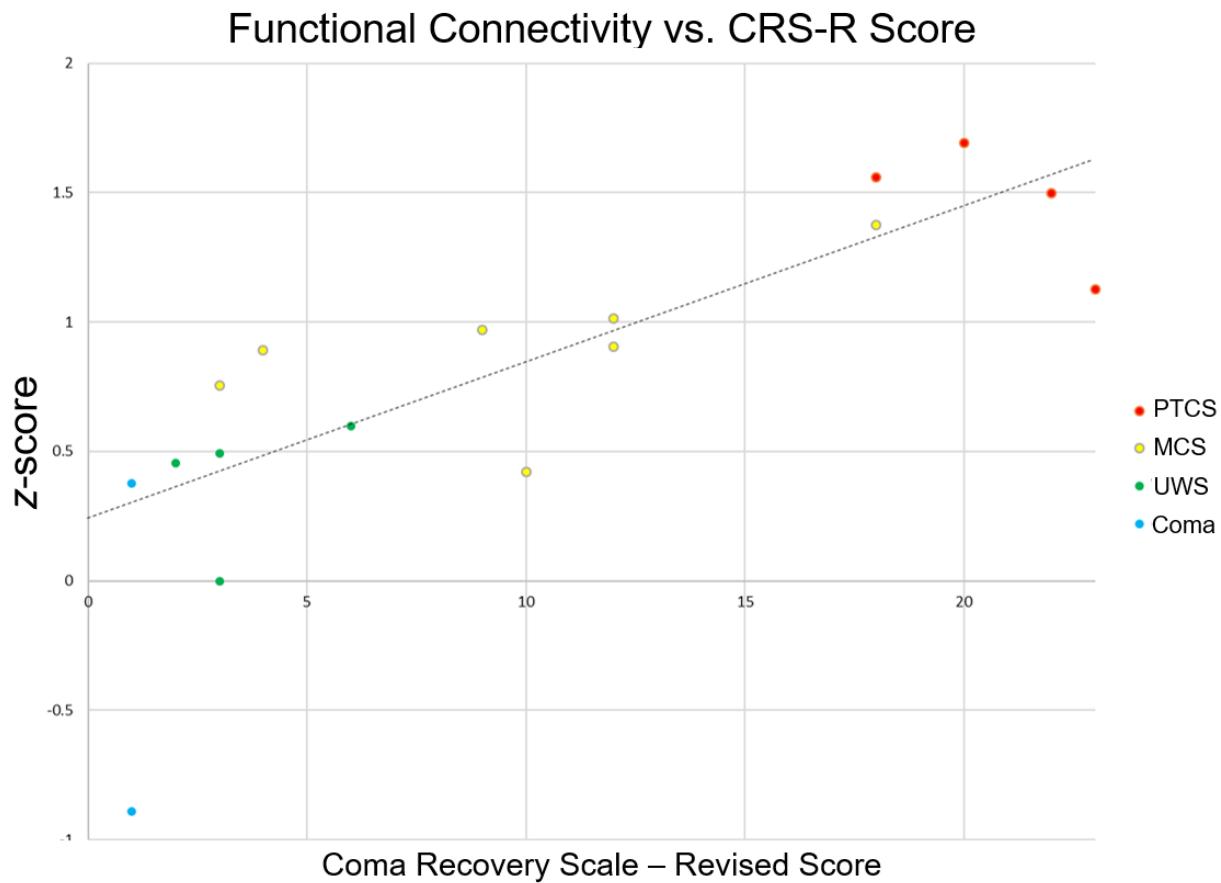

A representative axial image from each normalized structural (A) and functional (B) dataset is shown with the overlying Montreal Neurological Institute (MNI) template. Images are oriented in neurologic convention (left is left). C1-C16 = healthy controls; P1-P17 = acute patient scans; \* = follow-up patient scans.

**Supplementary Fig. 2 – Correlation and anticorrelation masks used for extraction of global mean correlation and anticorrelation  $z$ -scores.**

Masks were computed from voxels positively (correlation) or negatively (anticorrelation) correlated with default mode network seeds across all patients and healthy subjects.

**Supplementary Fig. 3 – Acute default mode network connectivity is associated with Coma Recovery Scale-Revised scores.**

In a post-hoc analysis, mean z-scores in the posterior cingulate cortex and medial prefrontal cortex regions were extracted for each patient with acute DoC (n=17) and compared with concurrent Coma Recovery Scale-Revised total scores (Spearman's  $\rho = 0.88$ ). MCS = minimally conscious state; PTCS = post-traumatic confusional state; UWS = unresponsive wakefulness syndrome.

#### Supplementary Fig. 4 – Subject-level longitudinal changes in default mode network

correlations and anticorrelations.
